NEW HORIZONS 2026 / PROJECT SCOPE

Live Event Dashboard

Business Requirements & Scope Brief | Event Screen & Staff Controller

Overview & Objective

New Horizons 2026 is a business networking and matchmaking event using b2match for registration, event check-ins, meetings, and post-meeting feedback. The project includes two digital solutions; this brief covers only the live event dashboard and its supporting staff controller.

The goal is to present event progress on a large venue screen through three clear, instantly understandable measures. Numbers should be prominent, easy to read from a distance, and updated throughout the event.

Dashboard Measures

PILLAR	DISPLAYED INFORMATION
MEET	Registered participants vs. checked-in participants. Show the total registrations and the number of people who have checked in using the event QR process.
MATCH	Target meetings vs. meetings conducted. Show the agreed meeting target and the running total of meetings recorded as conducted.
GROW	Average meeting feedback rating (1–5 stars). Show the average of ratings entered, with the total number of ratings received. Written comments are not displayed.

Hybrid Data Update Approach

Automatic — participant figures: Registered and checked-in participant totals are retrieved from the available b2match public API and refreshed automatically on the event dashboard.

Staff-controlled — meetings: Meeting and feedback data are not available through the provided public API. Event staff will keep a simple controller page open alongside the b2match admin portal. When a newly conducted meeting is recorded, staff press +1 Meeting to increase the live total.

Staff-controlled — feedback: For each new meeting rating shown in b2match, staff select the corresponding 1–5 star value in the controller. The dashboard updates the number of feedback submissions and recalculates the average rating.

Display & Operational Requirements

The public-facing display will present the three measures in a clean, uncluttered, large-screen layout. API-sourced values refresh automatically; controller changes should appear promptly without manually reloading the event screen. The staff controller is a separate operational interface and is not shown to attendees.

Expected Deliverable

A live event display for Meet · Match · Grow, supported by automatic participant-data updates and a lightweight staff controller for meeting and feedback updates.
